

BSA002 - Business Systems Analysis for Software Development (4 Days)

Requirement gathering is the cornerstone of any software development project. In this course, participants will gain the knowledge and skills needed to capture software requirements using clearly defined processes. You learn to specify user and system requirements, match the process to the size of your project, and apply quality and consistency tests to the requirements model.

Target Participant:

This course is for participants who are developing, leading, designing, testing or managing a requirements initiative for a software system. UML experience is not required.

Prerequisites

- Business analyst training BA001
-
